

Setup Directions:

- 1) Open *index.html* in Google Chrome. It should open, but looks really, really big. This is normal.
- 2) Press F12 to open Chrome's Developer Tools.

About the Prototype:

I would highly recommend using the Nexus 6P to browse the prototype. If buttons appear grossly out of alignment, try a different emulated device. Some work better than others.

Login, creating an account, creating or joining a fridge, are all simulated. Regardless of the username/password you input, you will be “logged in” to the same fridge, with some Fridge, List, and Request items already populated. Most of the interactions between the Fridge/List/Requests are functional.

In “Settings,” the only buttons that take you anywhere are *Fridge Registration*, *Manage Fridge Users*, and *Log Out*. None of these features actually do anything, but you do get taken to other screens.

If any problems are run into during marking, please ping me on Slack, and I’ll be happy to resubmit.
